Priority number(s):

Abstract of JP11155048

PROBLEM TO BE SOLVED: To facilitate a countermeasure to the aged deterioration of a light source or the like which is generated in a conventional method for correcting shading distortion generated due to non-uniformity of a light source or an optical system or the like.

SOLUTION: This is a picture read device equipped with a contact image sensor 23 constituted of an illuminating means for illuminating at least an original 21, light introducing means for image forming a reflected light from the original 21 in a prescribed distance, optoelectric converting means for converting an image formed original image into an electric signal with prescribed resolution, contact glass 41 for forming the carrying path of the original, and a case for holding each means as a reading means for the original 21. In this case, the optical characteristics of the contact glass 41 can be arbitrarily controlled.
